#Header Section

Qarabağ University

Faculty of MATH and IT

Specialty: Computer Engineering

Course: Introduction to Python Programming

Laboratory Assignment № 1

Topic: Conditional Statements and Decision-Making in Python (`if`, `elif`, `else`)

Student Name and Surname: İsmət Qurbanov

Instructor: Şamil Hümbətov

#Task Descriptions

Task 1: Body Mass Index (BMI) Calculator

Objective: Calculate the user's Body Mass Index (BMI) based on entered weight in kilograms and height in meters, and determine the corresponding health category.

Working Principle: The program uses the standard formula BMI = weight/(height*height). Based on the result, it uses `if-elif-else` conditional statements to classify the user as Underweight, Normal Weight, Overweight, or Obese.

Task 2: Chinese Zodiac Calculator

Objective: Determine the Chinese Zodiac animal sign based on the user's birth year.

Working Principle: The Chinese zodiac follows a 12-year cycle. The program calculates the remainder of the year divided by 12 (`year % 12`). Depending on the remainder (0 to 11), it displays the corresponding animal such as Monkey, Rooster, Dog, Pig, Rat, Ox, Tiger, Rabbit, Dragon, Snake, Horse, or Sheep.

Task 3: Birthday Guessing Game

Objective: Guess the user's birthday date of the month logically using 5 predefined number sets without asking the date directly.

Working Principle: The program displays 5 separate number sets and asks whether the birthday is included in each set (`1` for Yes, `0` for No). It sums up the first numbers of the sets where the user answered "Yes" to accurately calculate and display the birth date.
